Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                          cytostatic, dermatological; cardiant; virucide, ophthalmological; keloid; stin disorder; insulin-like Growth Pactor 1 receptor; IGF2-1; pitcyriasis, IGF binding proctein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilaris; growth factor mediated cell proliferation; ichthyosis; serborrhoes; rubs; keratosis; neoplasis; scleroderms; wart; skin cancer; sclerotic disease; hypermeovascular condition; hyperplasis, kidney disease; neovascular condition; hyperplasis; kidney disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      akin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGF]-1, which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AAP45151 and AAF45153-F45161). The method is useful for amaliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, varts, benign growths, cancers of the skin, a hyperneovascular condition of as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        present invention relates to a method for ameliorating the effects of
                                                                                                                                                                                                                                                                                      Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (FTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBRT), protein kinase C alpha (FKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (HRB2/), cerb2/neu), phospholaman (PLN), presenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes tinclude hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, zinclude hammerhead (HH), hairpin, nCH (inozyme), d-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer, Alzheimer's disease, disease, diabetes, obesity, cardiac diseases e.g. heart disease, age-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chowrira
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Usman N, Blatt L, Beigelman L, Burgin A;

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase.lb (PTB-1B), methionine alpha (PKC alpha), beta-secretase (BTRRT), protein kinase C alpha (PKZ)-erbZ/neu), phospholamban epidermal growth factor receptor-2 (HRRZ/C-erbZ/neu), phospholamban (PLM), presenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, MCH (inozyme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer, Alzheimer's disease, diabetes, obesity, cardiac diseases e.g. heart disease, age-related diseases, hepatitis B infections, and hepatitis and hepatocellular carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased calls and to detect the presence of specific RNA in a cell. The present colls are repeated more than once in the specification, but these have
are used for treating cancer, Alzheimer's disease, hepatitis, diabetes, obesity and heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 15 BP; 1 A; 6 C; 4 G; 0 T; 4 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBRT), protein kinase C alpha (FKC alpha), beta-secretase (BACB), human epidermal growth factor receptor-2 (HER2/c-erbZ/neu), phospholamban (PLM), presenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful cor treating cancer, in particular breast cancer, Alzheimer's disease, disease, disease, hepatitis B infections, and hepatitis and hepatocellular carcinoma. The enzymatic nucleic acid molecules can also be used as diseased; calcinoma. The enzymatic nucleic acid molecules can also be used as disagnostic tools to examine genetic drift and mutations within diseased cells and to detect the presence of specific RNA in a cell. The present sequence represents a substrace/target sequence for an anti-HERZ ORCH ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have

The present invention relates to a new polynucleotide comprising a nucleotide sequence which is a polymorphic variant of a reference sequence for lecithin-cholesterol acyltransferase (LCAT). The invention is useful for identifying an association between a trait (preferably a clinical response to drug targeting LCAT) and at least one genotype or haplotype of LCAT gene. The method of the invention has applicability in developing diagnostic tests and therapeutic treatments for Norum disease, fish-eye disease and atherosclerotic cardiovascular disease. The haplotyping and genotyping methods are useful for studying population diversity, anthropological lineage, the significance of diversity and lineage at the phenotypic level, paternity testing, forensic applications crait such as level of drug response or usceptibility to disease. In addition, the methods for identifying the LCAT haplotypes present in addition, the methods for identifying the LCAT haplotypes present in campit the frequency of individual LCAT haplotypes in a population with a specific disease, e.g. Norum disease, will facilitate the development of drugs targeting the LCAT isoform(s) that are most the development of drugs targeting the LCAT isoform(s) that are most treatment in that disease population. The present nucleic acid sequence represents one of a collection (ARSO4748-ARSO49491) of allele-specific oligonucleotide (ASO) probes that were used in the invention to detect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

```
The invention relates to genotyping a human UDP glycosyltransferase

(UGTIA1) gene of an individual, involving determining for the two copies

(UGTIA1) gene present in the individual, the identity of the

nucleotide pair at one or more polymorphic sites. The new method is

useful for determining whether an individual has a haplotype or haplotype

pairs, given in the specification. It is useful for improving the

efficacy and reliability of several steps in the discovery and

development of drugs for treating diseases associated with UGTIA1

activity, e.g., Gilbert's syndrome and Crigler-Najjar syndrome, to

validate UGTIA1 as a candidate agent for treating a specific condition or disease predicted to be associated with UGTIA1 activity. The

design of clinical trials of candidate drugs for treating a specific

condition or disease predicted to be associated with UGTIA1 activity. The

method is useful to screen for compounds targeting UGTIA1 to treat a

specific condition or disease associated with UGTIA1 activity. A nucleic

acid (I) comprising a polymorphic variant of a reference sequence for the

UGTIA1 gene or CDNA (II) or itsefunded to useful in studying the

expression and function of UGTIA1, and in expressing UGTIA1 protein for

use in screening for candidate drugs to treat diseases related to UGTIA1

cactivity. (I) or (II) is useful for treating and testing of drugs

the UGTIA1 isogenes in vivo, for in vivo screening and testing of drugs

the UGTIA1 isogenes in vivo, for in vivo screening and testing of trugs

New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.

Claim 1; Page 27; 80pp; English.

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprises sequences complementary to one of the substrate sequences defined in the specification. The HCV incompasses are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhozymes are used useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon. The present sequence appears a substrate for a HCV hammerhead (HH) ribozyme. Note: some of the sequence data for this patent was printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at seqdata.uspto.gov/psipsDIDEntry.html

The invention relates to an enzymatic nucleic acid molecule which specifically cleaves minus strand RNA derived from hepatitis C virus (HCV). The binding arms of the molecule comprise ribozyme sequences. The molecule is selected from inozyme, (2-cleaver, DNAzyme, Amberzyme, and comprising the novel enzymatic nucleic acid; (2) a mammalian cell including the novel enzymatic nucleic acid; (3) an expression vector comprising a nucleic acid sequence encoding at least one enzymatic nucleic acid molecule, in a manner, which allows expression of that comprising a nucleic acid sequence encoding at least one enzymatic molecule; (4) a mammalian cell including an expression of that comprising a nucleic acid molecule, in a manner, which allows expression of that carcinoma by administering to a patient the novel enzymatic nucleic acid or the vector of (3); (6) a method of treating a patient having a condition associated with HCV infection, by contacting cells of the patient with the nucleic acid molecule, and further employing one or more drug cherapies; (7) a method for inhibiting HCV replication in a mammalian cell by administering the novel enzymatic nucleic acid with the separate RNA molecule by contacting the novel enzymatic nucleic acid with the separate RNA molecule. The enzymatic nucleic acid is useful for modulating the expression of HCV minus strand. The nucleic acid may also be used to treat or prevent the occurrence of a nucleic acid may also be used to treat or prevent the occurrence of a

The invention comprises a human monoclonal antibody that binds to phospholipase A2 (PLA2). The monoclonal antibody of the invention is useful in the preparation of a medicament for the treatment of inflammatory and degenerative disorders atteming from inflammatory reactions in the joints, skin, and blood vessels, arthritis, psoriasis, asthma, Alzheiner's disease, atherosclerosis, and restenosis. The present nucleic acid represents a human PLA2-specific monoclonal antibody heavy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human monoclonal antibody that binds to phospholipase A2 (PLA2), useful for treating inflammatory conditions, e.g. arthritis, psoriasis, asthma, Alzheimer's disease, atherosclerosis, or restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention comprises a human monoclonal antibody that binds to phospholipase A2 (PLA2). The monoclonal antibody of the invention is useful in the preparation of a medicament for the treatment of inflammatory and degenerative disorders stemming from inflammatory reactions in the joints, skin, and blood vessels, arthritis, psoriasis, asthma, Alzheimer's disease, atherosclerosis, and represent nucleic acid represents a human PLA2-specific monoclonal antibody heavy
                                                                                                                                                                                                                                                                                         New human monoclonal antibody that binds to phospholipase A2 (PLA2), useful for treating inflammatory conditions, e.g. arthritis, psoriasis, asthma, Alzheimer's disease, atherosclerosis, or restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gapa

                                                                                              The invention comprises a human monoclonal antibody that binds to phospholipase A2 (PLAZ). The monoclonal antibody of the invention is useful in the preparation of a medicament for the treatment of inflammatory and degenerative disorders stemming from inflammatory reactions in the joints, skin, and blood vessels, arthritis, psoriasis, asthma. Alzheimer's disease, atherosclerosis, and restenosis. The present nucleic acid represents a human PLAZ-specific monoclonal antibody heavy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a kit for detecting aquatic animal pathogens and human pathogens, comprising a pair of PCR primers used to detect specific DNA fragments of Vibrio fluvialis. The kit and method can be used in bacteria tracking and detection of aquatic animal pathogens in the course of breeding and also in the clinical detection of human intestinal acute infections, as well as in environmental monitoring. This sequence
useful for treating inflammatory conditions, e.g. arthritis, psoriasis, asthma, Alzheimer's disease, atherosclerosis, or restenosis.

```
The inventors claim vectors for the expression of heterologous proteins in mammalian cells. Each vector has a first and second consensus sequence (CS). The CS or their homologues are present in Known murine autonomously replicating sequences (MuARS). The first CS is homologous to ANN92945. The inefficient selection system comprises the tk gene and a truncated tk promoter. The vectors also contain a gene coding for a protein and the necessary promoter and terminator sequences for the expression of this gene. The expression vectors provide rapid amplification, allow selection of best clones in a short time, are of universal utility in mammalian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Expression vectors for mammalian cells - with two consensus sequences and inefficient selection system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss;

                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but fire wipo.int/pub/published_pct_sequences

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligoners for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The coligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligonucleotide primer SEQ ID NO 317619 for detecting SNP TSC0028141.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                         set or oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.

and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABR0010-ABC9989, ABR0010-ABS9989, ABR0010-ABS9989, and ABI0010-ABI82073 represent the oligomers described in the invention. NoTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fip.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastem, gastem, gasteming respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABR59989, ABR00010-ABR99989, ABR00010-ABR99989, ABR00010-ABR99989 and ABI00010-ABR82073 represent the oligomers described in the invention. NOTE: The sequence was obtained in electronic format from WIPO at the printed specification, but ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel oligonucleotide primers or peptide nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Oligonucleotide primer SEQ ID NO 318752 for detecting SNP TSC0028845.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF80031 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but ftp.wipo.int/pub/published_pct_sequences

Aurine p16 coding sequence fragment.

32-MAR-2001 (first entry)

```
This invention describes the use of novel acidophilic and thermostable xylanase enzymes (XYL I and XYL II) from Actinomadura sp. PC7 which retain their activity under harsh industrial conditions (e.g. high temperature or wide pH ranges) and may be secreted by recombinant host calls, to treat plant biomass. Xylanases XYL I and XYL II are part of a large group of hemicallulase enzymes and function by cutting the beta-1,4 bonds within the xylosic chain of xylan (a polymer of D-xylose residues that is a major constituent of hemicallulose). This means that they may be used in the paper and pulp industry to improve the efficiency of the heaching process by degrading the structure of the material. XYL I and XYL II may also be used to treat feed, by degrading a substrate with a high beta-glucan or callulose content. XYL I and XYL II retain their activity at high temperatures (e.g. 7) deg. C) and at low pHs (e.g. 4.0), conditions which tend to denature most known xylanases. Enzymes that remain active in these conditions may be used in industrial processes that are carried out at high temperature and low pHs to speed up other, non-enzymatic reactions, minimish costs, energy requirements, and the facilitate chlorine blacching of paper pulp which is a carried out in hot, acidic conditions). Pretreatment with XYL II and XXL II, allows the bleaching agents to penetrate better, to remove lignin from the pulp and secular can be used to produce the same or a better result. Also, disrupting the structure aids water drainage. NOTE: This patent is an equivalent to PI9503640. (Updated on 25-MAR-2003 to correct DR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New acidophilic and thermostable xylanase enzymes from Actinomadura sp. PC7 - useful for treating plant biomass, especially paper and wood pulp, to degrade hemicellulose and hydrolyse xylan.
                                                                                                                                             Xylanase; acidophilic; thermostable; XYL I; XYL II; plant biomass; hemicellulase; beta-1,4 bond; xylosic chain; xylan; D-xylose; paper; pulp; chlorine bleaching; feed; beta-glucan; cellulose; lignin; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  13.5%; Score 10.4; DB 1; Length 13; 75.0%; Pred. ö The present invention relates to a method for identifying a gene with a selected function comprising contacting genes with a library of ribozymes and identifying at least I ribozyme that alters the selected function of the gene. The present sequence is a target sequence used in the present invention. The methods (and ribozymes) are useful for identifying novel genes involved in retinal degradation, retinal disease, learning or memory, amylotropic lateral solerosis or tumour suppression, and for producing non-human animal models of diseases SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.                                                                                                                                                                                                                                                                                                                                           This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABR00010-ABF99989, ABR00010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence was obtained in electronic format from WIPD at the printed specification, but the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                 This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF99989, ABH00010-ABF99989 and ABI00010-ABF80013 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically precreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting call type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABF99989 and ABI00010-ABF8073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                    요
                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                             This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences
system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (\mathrm{SNP})
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                 Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Set of oligonucleotides, useful for diagnosis and cell typing, ideaigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ;

ö
and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABR0010-ABH99989 and ABI0010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fire.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretraeted genemic DNA. The oligomuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99999, ABF00010-ABH99999 ABF00010-ABH99999 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invantion. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at ftp.wipo.int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cycosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and methololic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABI82073 tepresent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010

The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hairpin ribozyme, which cleaves the Hepatitis C virus (HVC) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme cleavage sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by chucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hiterferon to treat HCV infection, other infectious diseases, autoimmune carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV into the substrate sequences defined in the specification. The HCV into transpares are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more condition associated with HCV infection in conjunction with one or more condition associated with HCV infection in conjunction with one or more interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hairpin (HP) ribozyme. Note: Some of the sequence data for this patent was brinted specification. The complete sequence data for this patent was obtained in electronic format directly from the USPFO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme; HCV expression, HCV replication, cirrhosis, virucide, liver failure, hepatococlullar carcinoma, HCV infection, drug therapy, type I interferon, interferon alpha; interferon beta; cytostatic; interferon gamma; consensus interferon, hepatotropic, antiinflammatory; substrate; hairpin ribozyme; HP ribozyme; se.

The invention relates to an enzymatic nucleic acid molecule which specifically cleaves minus strand RNA derived from hepatitis C virus (HCV). The binding arms of the molecule comprise ribozyme sequences. The molecule is selected from inozyme, G-cleaver, DNAzyme, Amberzyme, and conjugate motifies. Also described: (1) a pharmaceutical composition.

Zinzyme motifis. Also described: (1) a pharmaceutical composition comprising the novel enzymatic nucleic acid; (2) a mammalian cell including the novel enzymatic nucleic acid; (3) an expression vector comprising a nucleic acid sequence encoding at least one enzymatic nucleic acid molecule, in a manner, which allows expression of that molecule; (4) a mammalian cell including an expression vector of (3); (5) methods for treating cirrhosis, liver failure or hepatocellular carcinoma by administering to a patient the novel enzymatic nucleic acid or the vector of (3); (6) a method of treating cells of the patient with the nucleic acid molecule, and further employing one or more drug the nucleic acid molecule, and further employing one or more drug the nucleic acid molecule, and further employing one or more drug cell by administering the novel enzymatic nucleic acid, and (8) a method of cleaving a separate RNA molecule by contacting the novel enzymatic collision of cleaving a separate RNA molecule. The enzymatic nucleic acid acid and the the separate RNA molecule. The enzymatic nucleic acid cid cid cid cid cid any also be used to treat or prevent the cocurrence of a disease state in a patient. The present tencer represents an HCV hairbul ribozyme target substrate sequence represents an HCV hairbul ribozyme target substrate sequence represents in the expression of the present invention.

AAQ99394-Q99396 are primers used to identify DNA from both allogeneic and syngeneic sources to determine where a specific gene is expressed. The ATF-1 gene is a differentially expressed allogarift gene which is expressed allogarift gene which is expressed allogarift is an educing transplant rejection. Identification of the AIF-1 product (AAR80520) or transcript indicates that allograft rejection is taking place. The human AIF-1 gene and product are therefore useful in the diagnosis of transplant rejection. The diagnosis of transplant rejection. The diagnostic methods stage and require only a small amount of biopsy material
                                                                                          AIP-1, allograft inflammatory factor 1; transplant rejection; inhibitor; immunogenic; detection; diagnosis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Differential display of mRNA; reverse transcription; DDRT-PCR; human; chondrocyte; gene specific; primer; probe; isolation; interleukin-lbeta; IL-lbeta; diagnosis; connective tissue disease; oseteoarthritis; rheumatoid arthritis; polymerase chain reaction; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA encoding allograft rejection factors and immunogenic fragments useful for identifying transplant rejection inhibitors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Two primers are used to amplify any given mRNA molecule in its CDNA form. The first primer is capable of binding either to (1) a site immediately upstream of the first adenine nucleotide of the poly A tail; (2) to a site including the mRNA's poly A signal sequence; (3) to a site including the mRNA's poly A sequence of an mRNA of which the nucleotide sequence or (4) to a sequence of an mRNA of which the nucleotide sequence is known. These primers are then extended by reverse transcriptase to produce the corresponding cDNA sequence. The second primer comprises an arbitrary sequence and is used alongside the first primer to amplify the cDNA molecule by PCR. This primer is a second arbitrary primer. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Arbitrary RT-PCR primers (AAT75118-42) were used to amplify mRNA from cells exposed to hyperphysiological, normal or subphysiological levels of
                                                                                                                                                                                     The present sequence is 1 of 25 arbitrary 5' oligodecamer primers, which were used along with 4 degenerate 3' oligo dT primers for the differential display of human chondrocyte mRNA by reverse transcription and FCR (DDRT-PCR). Sequence analysis revealed the sequences of 52 cDNA clones, which were then searched against DNA databases for homology to known human genes. The cDNA mols. can be used for the prodn. of gene specific primers and probes to isolate genes induced by treating (esp. human) chondrocytes with interleukin-lbeta (IL-lbeta), and for the diagnosis of IL-lbeta related connective tissue diseases, in partic.

                discrete fractions which were increased or decreased were identified.

This method was used to identify mRNA and the corresponding cDNA which are increased in the cells of a patient having hyperhomocysteinaemia or a predisposition to homocysteine mediated atherosclerosis. These polynucleotides can be used for the diagnosis and treatment of atherosclerotic diseases and diseases of metabolism of sulphur containing amino acids (e.g. homocysteinaemia), which are associated with vascular damage and atherosclerotic disease, specifically unstable angina, acute myocardial infarction (heart attack), cerebrovascular accidents (stroke), hypertension, renal artery stenosis, aortic stenosis and deep vein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              primers AAV10683-V10688 are used to obtain novel human breast cancer genes by differential display. The identified genes or fragments of these genes can be used for identifying genes and gene products that are intimately related to malignant transformation or maintenance of the malignant properties of cancer cells. It can also be used to design or screen diagnostic reagents or therapeutic compounds. Kits are included within the scope of the invention
                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Breast cancer genes - used to develop products to design or screen diagnostic reagents or therapeutic compounds.
homocysteine. PCR products were separated on a sequencing gel and

New Brassica napus nucleic acid and protein, useful for regulating pod dehiscence and/or plant abscission by producing transgenic plants or propagating material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PCR primer AAX34944-45 were used to amplify DNA encoding a dehiscence zone protein designated ORS7(9). The ORS7(9) polymucleotides and polypoptides are useful for regulating pod dehiscence and plant abscission. Antisense ORS7(9) nucleic acid useful for preventing or reducing dehiscence or abscission.
                                                                                              PCR primer for DNA encoding a dehiscence zone protein ORS7(9).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PCR primers AAV15590 and AAV15591 are used to amplify fragments of the C4.8 and C21.7 genes from a human papillomavirus (HPV) immortalised human foreskin keratinocyte cell line HFR-1A. These genes are characteristic of late or early passage cells can be used in a method for assessing the potential for progression of cervical lesions. Antibodies generated and to assess potential for lesion progression. Antibodies can also be used therapeutically by inhibiting the polypeptide are used to an also be based on the nucleotide sequence are used to inhibit expression of the protein. Detecting polypeptides, or related RNA, characteristic of late passage cells (which are potentially malignant) in cervical smears is a reliable way of assessing progression potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid characteristic of late or early passage cells immortalised by papilloma virus - and related polypeptide(s) and antibodies, used for diagnosis and treatment of cervical cancer and assessing potential for progression of cervical lesions.

```
The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The nucleic acids and proteins are useful for regulating or controlling dehiscence of a pod or an anther in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter-delayed plants such as oilseed rape (Brassica napus)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a primer used to amplify Rin2 cDNA sequences. Rin2 polypeptides downregulate functional responses elicited by Ras-dependent signalling pathways. Agents that increase Rin2 activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Rin2; downregulation; functional response; allergy; asthma; hayfever; Ras-dependent signalling pathway; allergy; asthma; hayfever; atopic cozema; Ras-dependent cance; neoplastic cellular proliferation; autoimmune disease; T cell-associated disease; T cell dependent graft vs. host disease; type I diabetes mellitus; multiple sclerosis; Crohn's disease; autoimmune hepatitis; psoriasis; wound healing; angiogenesis; re-epithelialization; numnune deficiency virus; immune suppression; cancer therapy; nerve regeneration; PCR primer; ss.
                                                                                              A nucleic acid encoding a signal transduction protein involved in plant dehiscence, useful for producing shatter resistant male sterile plants.
                                                                                                                                                                                                                                                                                                                                  13.0%; Score 10; DB 1; Length 10; 100.0%; Pred. The present invention describes nucleic acids comprising human, murine or rat cDNAs encoding DRM proteins (derived from the down-regulated in v-mos transformed calls, drm gene). The nucleic acids, and DRM proteins, are useful for arresting call growth; inhibiting tumour call growth; treating hyperproliferative cellular disorders, either in vivo or ex vivo and producing fusion proteins with enhanced green fluorescent protein (BGFP) of increased stability (useful in screening assays, protein-protein interaction studies, cell labeling and as markers during purification). Detecting abnormally low levels of DRM, or the nucleic acids, may be used to identify subjects with an increased risk of developing as useful as probes and primers to detect or quantify drm and to screen genomic and convex introduces raised against DRM can be used to convex in immunoassays. Pusion proteins of DRM and GFP are localised to the nucleus (in contrast cytoplasmic localisation of GFP ö (particularly Rin2 itself, optionally expressed from a vector) are used to treat allergy (asthma, hayfever or atopic eczema); Ras-dependent cancers and (non-)neoplastic callular proliferation; autofmumue diseases; T cell-associated diseases and T cell dependent graft vs. host disease (typical examples being type I diabetes mellitus; multiple sclerosis, Crohn's disease, autoimmune hepatitis and psoriasis). Agents that inhibit Rin2 activity are used to improve wound healing; angiogenesis and/or respithelialization (also to improve immune response to pathogens; in human immune deficiency virus, and some other, infections; immune suppression associated with cancer therapy, and nerve regeneration) DRM; secreted protein; cell growth inhibition; fusion protein; tumour; green fluorescent protein; GFP; hyperproliferative cell disorder; enhanced green fluorescent protein; BGFP; diagnosis; PCR primer; ss. New isolated nucleic acid encoding DRM protein, for regulation of cell growth, particularly treating cancer and. Gaps ö 13.0%; Score 10; DB 1; Length 10; 100.0%; Pred. These cancer specific genes are desiganted C1-9a1-2, CH8 -2a13-1, CH13-2a12-1, and CH14-2a16-1. These genes show RNA voerabundance in a majority of cancer cell lines tested, as well as a gene duplication in many of the cancers. Probes and primers derived from the polymocleotide sequence may be used to mesaure or detect altered gene polymocleotide sequence of RNA in cancerous cells. This allows the screening of cancer, especially breast cancer, by correlating gene cuplication of RNA overexpression obtained in this method with an cincased risk for cancer. The polypeptide, and its antibodies, are used as reagents for detecting altered protein expression in cancerous cells. Both the cancer associated polypeptide and polymocleotide may be used to gene therapy to treat cancers such as lung cancer, plioblastoma, myeloma and
                                                                                                                                                                                                                                                                                       ö
itself) and so are more stable, e.g. on exposure to fixatives or detergents, and thus form more versatile reagents, e.g. they can be used in fluorescence-based assays that require cell fixation, or linked to proteins or antibodies for use in enzyme-linked immunosorbent assays. Stable EGFP can be attached to proteins during synthesis, allowing the labeling of materials that are too unstable for chemical modification. The present sequence represents a PCR primer for rat DRM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cancer associated gene; cancer specific gene; C1-9a11-2; CH8-2a13-1; CH13-2a12-1; CH14-2a16-1; cancer; gene duplication; RNA overabundance; breast cancer; lung cancer; glioblastoma; pancreatic cancer; colon cancer; prostate cancer; hepatoma; myeloma; probe; ss.

expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially expressed in dendritic cells, while preferentially or differentially expressed in dendritic cells, while confer transcripts correspond to novel genes. Antigen-presenting cell cher transcripts correspond to novel genes. Antigen-presenting cell (APC) -associated costimulatory factors play an important role in the activation of the cytotoxic immune response, particularly against tumour cells, immunostimulatory cofactors also being required for cells. Tumour antigen presentation via the WHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone the tumour cells, immunostimulatory cofactors also being required for cefficient activation of cytotoxic T-lymphocytes (CTIS). Nucleic cail sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of diseases related to abnormal expression of these genes. Detection of diseases related to abnormal expression of these genes. Detection of diseases related to abnormal expression of these genes. Detection of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proteins, can be used in active immunotherapy (or to stimulate production of a population of antigen-specific effector cells) and vectors containing them are used in active immunotherapy (or to stimulate production of the mannary adequate antigen presentation of co-stimulatory factors enumers adequate antigen presentation of co-stimulatory signals, migration of chemokines and

                                                                                                                                                                       The patent discloses fifteen new salicylic acid (SA) inducible genes from Nicotiana tabacum, nine of which were subcloned and sequenced. Based on Aifferent Kinetics of induction response, these genes were classified into four categories, class I, II, III and IV response genes. The SA-inducible genes are useful for making transgenic plants with enhanced pathogen resistance. The plants incorporating these genes show reduced susceptibility to fungal pathogens. The present sequence is an upstream primer API used in differential display PCR reactions along with downstream primers T12MG or T12MC to identify tobacco SA-inducible genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detection of microorganisms and viruses, for use in the food and cosmetic industries and for clinical diagnostics.
                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention provides a novel in vitro method for the detection of microorganisms and viruses. The method comprises: (1) forming a polymerase chain reaction (PCR) mixture by combining a predetermined volume of a sample to be tested for the presence of a nucleic acid sequence comprising 5. TAGAAGC-3', known amounts of a first primer comprising 5. GCTAAGGTCCCAAAGG-3', and a second primer comprising 5. GCTAAGGTCCCAAAGG-3', and product by AGAAGCCTCCTACC-3', and PCR reagents; (2) forming a PCR product by
                                                                                    Novel salicylic acid inducible genes from tobacco plants, useful for making transgenic plants with enhanced pathogenic resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Microorganism; virus; polymerase chain reaction; food; cosmetic; clinical diagnostic; molecular beacon; PCR primer; ss.

ö
cycling the PCR mixture to amplify the nucleic acid sequence, if present, to replicate and attain 0.25-10000mug nucleotide product/mul mixture; (3) adding a probe containing DNA comprising S'-GGTGGCTCTTAAGCCACC-3' to the PCR mixture or to the PCR product to cause the DNA to hybridize with the nucleic acid sequence, if present, and change the conformation of the probe; and (4) determining whether or not bacteria are present in the sample by detecting the conformational change indicating the presence of bacteria in the sample. The methods can be used for the detection of viruses and microorganisms, including bacteria, yeast, molds and protista. They can be used in the food and cosmetic industry and in clinical diagnostics. Using the method it is not necessary to remove non-hybridized probe from the system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes isolated DNA (I) encoding an allograft inflammatory factor-1 (AIF-1). AIF-1 has immunosuppressive, antiinflammatory and antiarteriosclerotic activities. AIF-1 is an inhibitor of expression of allograft factor such as Gal/GaINAc macrophage lectin. AIF-1 is useful for diagnosing and treating allograft rejection and other conditions associated to vascular inflammation, especially atherosclerosis. The present sequence represents a PCR primer which is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Allograft inflammatory factor 1; AIF-1; AIF-2; allograft gene; screening diagnosis; allograft rejection; vascular inflammation; atherosclerosis; immunosuppressive; antiinflammatory; antiarteriosclerotic; PCR primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular cell types.

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 140; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame; or nonamotated ORP) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate or antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for comprising contacting human genes which are involved in cell cycle progression of identifying human genes which are involved in cell cycle progression contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and conting expression in the yeast cell of at least 1 NORF gene whose expression in a yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF gene whose expression in the yeast cell of at least 1 cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44064.

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle. WPI; 2001-061874/07.

Example; Page 123; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising a SAGE (serial analysis of gene expression) tag. Also certification and the call of the comprising a SAGE (serial analysis of gene whose expression varies by at least 10% between any two phases of the call office is selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast call; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for the yeast gene is a candidate antifungal drug; (3) a method (M3) for the yeast gene is a candidate antifungal drug; (3) a method (M3) for comprising contacting with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell with a candidate drug and contacting a yeast cell with a candidate drug and cyeast cell comprising contacting a yeast cell with a candidate drug and contacting a peast of by a least of by sense whose expression in the yeast cell of at least 1 NORF genes may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. App33268 to AAP44064 crepresent SAGE tages used in the exemplification of the present invention.

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 200; 419pp; English

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORP (not previoually assigned open reading frame; or nonanotated ORP) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORP genes to affect the cell comprising administering a NORP gene whose expression varies by at comprising a comprising a NORP gene whose expression or arithmial drugs comprising (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORP gene whose expression of antifungal drugs (a) contacting a test substance which modifies the expression of varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at lm M1, and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a contiguous nucleotides of a NORP gene whose expression is affected by the class of the cell cycle progression in a continuous nucleotides are an administration of the cell cycle, the differentially expression is affected by the class of the cell cycle, the differentially expression is affected by the class of the cell cycle, the differentially expression is affected by the class of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle and cycle and for identification of antifungal drugs, APAF33268 to AAF431664 crepresent SAGS tags used in the exemplification of the present invention.

The sequence represents the rat arbitrary PCR primer AP-1, used in the invention to amplify CDNA from rat ovary tissue. The invention relates to a novel isolated UO-44 nucleic acid molecule comprising a sequence of a novelcides corresponding to a uterine cestrogen agonist-inducible corresponding to a uterine cestrogen agonist-inducible corresponding to a uterine cestrogen agonist-inducible corresponding to a meanmal. The UO-44 sequences of the invention have cytostatic activity. The UO-44 polynucleotide is useful in the candicament for the treatment of a condition in a mammal, corresponding diagnosing, detecting or monitoring uterine cancers and/or covarian cancers, and for producing the polypeptide. The polynucleotide or polypeptide is useful for monitoring uterine and ovarian growth and development and the level of cestrogenic activity in tissue including cancer tissue. They are also useful for the generation of a range of therapeutic molecules capable of modulating oestrogen agonist-mediating coll growth and proliferation in the uterus including ovaries. The UO-44 itself

A new microsatellite DNA derived from a Pyrus plant and discrimination of
                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises a novel microsatellite DNA sequence derived from Pyrus plants. The invention also comprises a method for discriminating Pyrus plants - utilising the novel Pyrus microsatellite DNA. The novel microsatellite DNA sequence can be used in discriminating Pyrus plants. The present DNA sequence represents a PCR primer specific for a novel Pyrus pyrifolia (sand pear) microsatellite DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Endometrium, placenta, serine protease, gynecological, cytostatic,

The present sequence relates to a new isolated nucleic acid molecule, which is expressed in endometrium and placenta and is upregulated in pregnant uterus and is highly expressed during placental development, encodes a protein having serine protease activity and has an insulin-like growth factor (IGF)-binding motif. The compound is considered growth factor association and cardiant. The enzyme is specifically expressed in association with embryo implantation and placentation in a pregnant uterus. The nucleic acid is useful for preparing a composition for treating PRSP-related condition e.g., infertility, endometriosis, cancer or a disease of the heart, testis or ovaries. Further, it is useful for detecting, diagnosing or monitoring a condition involving a change in PRSP expression. The sequence is present in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides the protein and coding sequences of human fructose-bisphosphate aldolase B (ALDOB) and single nucleotide polymorphisms (SNPs) which have been identified in each sequence. The method of haplotyping the sequences is useful for haplotyping the fructose-biphosphate aldose B (ALDOB) gene of an individual or for validating the ALDOB protein as a candidate target for treating a medical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                New nucleic acid encoding a protein having serine protease activity an insulin-like growth factor-binding motif, useful for preparing a composition for treating a pregnancy-related serum protease-related condition e.g., infertility.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.
condition predicted to be associated with ALDOB activity. The present sequence is an allele-specific primer/probe used to identify the haplotype of the human ALDOB gene in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying agents that alter biological activity of a polypeptide encoded by a polynucleotide involved in hypoxia-related tumorigenesis comprises contacting an agent with a target cell and monitoring activity

                                                                                                                                                                                                                                                                                                                                                                                                                             The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                             Identifying agents that alter biological activity of a polypeptide encoded by a polynucleotide involved in hypoxia-related tumorigenesis comprises contacting an agent with a target cell and monitoring activity

The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                encoded by a polynucleotide involved in hypoxia-related tumorigenesis comprises contacting an agent with a target cell and monitoring activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                   The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel device for gene analysis. The device comprises an insulation film substance, a semiconductor substrate and a reference electrode. The insulation film substance is immobilized on one side with a nucleic acid probe and contacted with a sample solution comprising a target gene, and the other side of the surface of insulation film substance is consected with the semiconductor substrate, and the reference electrode is in the sample solution. The novel device is preferably useful for analyzing a gene polymorphism. The device enables rapid, cost effective, highly sensitive and accurate gene analysis. This analysis of the invention.
encoded by a polynucleotide involved in hypoxia-related tumorigenesis comprises contacting an agent with a target cell and monitoring activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Device for gene analysis e.g. gene polymorphism analysis, comprises insulation film substance immobilized with nucleic acid probe specific for target, semiconductor substrate and reference electrode.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

It corresponds to an antisense sequence of a herpesvirus site, pref. in a gene that is essential for synthesising nucleic acids e.g. the immediate early genes or vmw65. It can be prepd. by solid phase triester or phosphor- amidite chemistry or by recombinant DNA techniques. It can be used for treating infection by herpesviruses, e.g. herpes simplex type 1 (HSV-1) and type 2 (HSV-2), varicella zoster (VSV), Epstein-Barr (EBV), cytomegalovirus (CMV), human herpesvirus 6 (HHV-6) and 7 (HHV-7). In addition, the inhibition of herpesvirus growth or replication may indirectly forestall the progression of events from HIV exposure to the clinical manifestation of AIDS. It may also be useful in the detection, diagnosis and manipulation of herpes virus. See also AAQ23764-Q23788 and AAQ24014-

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and merabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF99989, ABH0010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but the wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but ftp.wipo.int/pub/published_pct_sequences

```
and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABR0010-ABF9989, ABR0010-ABF9989, ABR0010-ABF9989, ABR0010-ABF9989, and ABI0010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at fire.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; 88; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligonucleotide primer SEQ ID NO 291908 for detecting SNP TSC0014997.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              set or oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.

                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                        This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but fip.wipo.int/pub/published_pct_sequences

```

This invention describes novel oligonucleotide primars or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oligonucleotide primer SEQ ID NO 278381 for detecting SNP TSC0005966.
                                                                                                                                                                                                          Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                            Claim 1; SEQ ID NO 291907; 29pp + Sequence Listing; German.

                                                                                                                                   acid (FNA) oligomers for detecting single nuclectide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF0010-ABP99989, ABF0010-ABF89989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                     This invention describes novel oligonucleotide primers or peptide nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel oligonucleotide primers or peptide nucleic acid (PMA) oligomers for detecting single nucleotide polymorphisms (GNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligonucleotide primer SEQ ID NO 347387 for detecting SNP TSC0045063.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but etp.wipo.int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but ftp.wipo.int/pub/published_pct_sequences

acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligoners for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for disgnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The coligoners are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABE9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in alectronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                          ligonucleotides, useful for diagnosis and cell typing, is to detect single-nucleotide polymorphisms and cytosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Claim 1; SEQ ID NO 4039; 29pp + Sequence Listing; German.

in a

acid (PNA) oligomers for detecting single mucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99999, ABF00010-ABF99999, ABF00010-ABF99999 ABF00010-ABF99999 and ABI0010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo.int/pub/published\_pct\_sequences This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at the printed specification, but ftp.wipo.int/pub/published\_pct\_sequences This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic. Gaps Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status. ö Oligonucleotide SEQ ID NO 137935 for detecting SNP TSC0034489.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99899, ABF00010-ABF99899, ABF00010-ABF99899 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cyrosine methylation status in chemically prereated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, azidovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic formmat from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             eet or oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WO200177384-A2
```

```
This invention describes novel oligonucleotide primers or peptide nucleic acid (PMA) oligoners for detecting single nuclecide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNN. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         bet of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; SEQ ID NO 265570; 29pp + Sequence Listing; German.
                                                                                                                                                                                                                                                                                                                                                                          WO200177384-A2
                                                                                                                                                                                                                                                                                                                                                           Homo sapiens

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABC0010-ABE99899, ABC0010-ABE99899, ABC0010-ABE99989, ABC0010-ABE99989 and ABI00010-ABE8073 represent the oligomers described in the invention. NOTE: The sequence was obtained in electronic format from WIPD at the printed specification, but ftp.wipo.int/pub/published\_pct\_sequences SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABR00010-ABH99999 and ABI00010-ABI32073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from MIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The coligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABE99899 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine
                                                                                                                                                                                                                                                                                                                                                        Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretraeted genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE09989, ABF00010-ABE99989, ABH00010-ABE99989, ABH00010-ABE99989, and ABI00010-ABE3073 represent the oligomers described in the invention. NOTE: The sequence
                                                                        This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF9989, ABH0010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPD at ftp.wipo.int/pub/published_pct_sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; 88; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Set of oligonucleotides, useful for diagnosis and cell typing, idesigned to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytoslie methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo int/pub/published_pct_sequences

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for disgnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                            SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a protein variant of the Yin Yang-1 transcription factor [1], having a 411 amino acid (aa) sequence (4) reproduced. Also described are: protein (Ia) that is a homologue of (4) and includes Arg a position 303 and 11; peptide (II) that is a fragment of (II) that is a fragment of (II) that is a reagment of (II) that encodes (II), [1a) or (II); peptide (II) that is a fragment of (II) that encodes (II), [1a) or (II); an antibody (Ab) directed against (II) or (Ia); methods for determining a tendency to develop type I diabetes; transgenic non-human mammal (A) in which the germ and somatic cells contain a nucleic acid (or segment) encoding 411 as sequence (2), or sequences with at least 95, hest 99* homology, where the homologue includes 303Met and 311Arg; and use of (A) to screen for compounds (B) that are protective against diabetes. The methods are useful for modulating activity of the YY1 (YIN Yang-I) multifunctional transcription factor. (I), or its homologues and peptides, also nucleic acids encoding them and antisense oligonucleotides, are useful for treatment of type I and 2 diabetes, autoimmune diseases, cancer and disorders of mineral and lipid metabolism. Detecting mutations in the human analogue of (4) is used to determine a predisposition for these diseases. Transgenic and the protein and animals of the contain the contain and animals of the contain and animals and anima
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         that contain the sequence encoding (4), or its homologues, are used to screen for agents protective against diabetes. This sequence represents a potential splice acceptor site for splice variants of yin yang-1
                                                                                                                                                                                                                                                                                                                                                                          New variant of the Yin Yang-1 transcription factor, useful for treating e.g. diabetes and autoimmune disease, also for diagnosing predisposition and in screening for therapeutic agents.

Probes AAT10983-4 are used for the specific detection of Haemophilus influenzae. They bind to a region of the H.influenzae 16S rRNA gene at pos. corresp. to bases 837-854 or 1255-69 of the B.coli 16S rRNA gene. The probes can also be used in the detection by the helper probes AAT10985-9. The probes are pref. labelled with an acridinium ester label. The probes are specific for H.influenzae and do not bind to nucleic acids from H.aphrophilus, H.ducrei, H.haemolyticus, H.parahaemolyticus, H.parahluenzae or H.paraphrophilus. (Updated on 25-MAR-2003 to correct Pfield.)

                                                                                                                                                                                                                                                      ઠ
                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                   ö
                                                                                                          The present invention describes enzymatic nucleic acid molecules (NAMS) which specifically cleave RNA derived from an epidermal growth factor receptor (EGP-N) gene. AAV97221 to AAV96043 and AAV9892 to AAV980900 represent specifically claimed target sequence from human EGP-R. AAV98044 to AAV98866 and AAV98867 to V9878 represent hammerhead ribozymes and hairpin ribozymes respectively for human EGP-R. The NAMS are useful for cleaving EGP-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMS can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGP-R RNA in a cell
                                            Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid hybridisation probe specific for Haemophilus influenzae - useful for identification of H. influenzae, optionally used with helper

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   probes.
                                                                                                                                                                                                                                                                                                                                                                                RESULT 291
```

8 셤 The present sequence represents a nucleic acid hybridisation probe that hybridises to Haemophilus influenzae rRNA in a region corresponding to nucleotides 1255-1268 of E. coli 16S rRNA. The probe can be labelled,

AAA1575 to AAA1761 to AAA1762 represent ribozyme sequences for ARNT, and AAA1761 to AAA1762 represent ribozyme sequences for AAA1768 to AAA19185 and AAA19185 and AAA19185 to AAA19181 and AAA19185 to AAA19181 and AAA11918 to AAA21891 and AAA11918 represent ribozyme sequences for Tite-2 and AAA119190 and AAA11891 to AAA21891 and AAA21891 to AAA21891 sequences; AAA118918 to AAA21891 and AAA21891 to AAA21891
                                                        probe does
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors.
especially with an acridinium ester, and used in an assay for H. influenzae, optionally together one or more helper probes. The probe doe not hybridise to nucleic acids from H. aphrophilus, H. ducreyi, H. haemolyticus, H. parahemolyticus, H. parainfluenzae or H. paraaphrophilus. The probe enables rapid, non-subjective identification of the presence of specific ribosomal RNA sequences that are unique to all serotypes and bio-types of H. influenzae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; aryl hydrocarbon nuclear transport; ARNT; TIB-2; anglogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; anglogenic factor; cytostatic; antidiabetic; ophthalmologic; antilnflammatory; antiatrhritic; antipsoriatic; ARND; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovageular glaucoma;

AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an manNa encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as angiofibrome of tuberous sclerosis, portains stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  in mammalian cells. Each vector has a first and second consensus sequence (CS). The CS or their homologues are present in known murine autonomously replicating sequences (MAMRS). The first CS is homologues to AAN92945. The inefficient selection system comprises the tk gene and a truncated tk promoter. The vectors also contain a gene coding for a protein and the necessary promoter and terminator sequences for the expression of this gene. The expression vectors provide rapid amplification, allow selection of best clones in a short time, are of universal utility in mammalian cells, and are free of viral origin sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Expression vectors for mammalian cells - with two consensus sequences and inefficient selection system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The inventors claim vectors for the expression of heterologous proteins

The present invention describes a compound (I) comprising 8-50

"C nucleobases which is targeted to a 5' untranslated region (UTR), coding,
"C nucleobases which is targeted to a 5' untranslated region (UTR), coding,
"A 2, group IIA (synovial), where the compound specifically hybridises with
and inhibits the expression of phospholipase A2, group IIA (synovial).

Also described: (1) a composition comprising the compound and a carrier
or diluent; (2) a method of inhibiting the expression of phospholipase
A2, group IIA in cells or tissues; and (3) a method of treating an animal
c having a disease or condition associated with phospholipase A2, group IIA
(synovial). (I) has antiinflammatory, antidiabetic, cytostatic and
antipsoriatic activities, and can be used in vaccines and in gene
therapy. The compound (I) can be used in vaccines and in gene
treating or preventing inflammation, cancer, psoriasis or diabetes. The
present sequence represents a human phospholipase A2 group IIA (synovial)

The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the target these sites and their activities optimised by either varying the rarget the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with hepatocellular carcinoma. The ribozymes may be used in combination with therferon to treat HCV infection, other infectious diseases, autoimmune

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV cribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more coher drug therapies, particularly type I interferon. The present sequence represents a substrate for a HCV hairpin (HP) ribozyme. Note: Some of the sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.

The invention relates to an enzymatic nucleic acid molecule which specifically cleaves minus strand RNA derived from hepatitis C virus (HCV). The binding arms of the molecule comprise ribozyme sequences. The molecule is selected from inozyme, G-cleaver, DNAzyme, Amberzyme, and Zinzyme motifs. Also described: (1) a pharmaceutical composition comprising the novel enzymatic nucleic acid; (2) a mammalian cell including the novel enzymatic nucleic acid; (3) an expression vector comprising a nucleic acid sequence encoding at least one enzymatic nucleic acid molecule, (4) a mammalian cell including at least one enzymatic molecule, (4) a mammalian cell including an expression vector of (3); (5) methods for treating to a patient the novel enzymatic nucleic acid or the vector of (3); (6) a method of treating a patient having a condition associated with HCV infection, by contacting cells of the patient with the respicated with HCV infection, by contacting cells of the patient with the respectate RNA molecule, py contacting the novel enzymatic nucleic acid or the novel enzymatic nucleic acid and cell or inhibiting the expression of HCV minus strand. The nucleic acid may also be used to treat or prevent the occurrence of a disease state in a patient. The present sequence represents an HCV nucleic acid may also be used to treat or prevent the occurrence of a disease state in a patient. The present sequence represents an HCV nucleic acid may also be used to treat or prevent the occurrence of a disease state in a patient. The presents sequence represents an HCV nucleic acid and the patient is used in the

The invention relates to a kit for detecting aquatic animal pathogens and human pathogens, comprising a pair of PCR primers used to detect specific DNA fragments of Vibrio fluvialis. The kit and method can be used in bacteria tracking and detection of aquatic animal pathogens in the course of breeding and also in the clinical detection of human intestinal acute infections, as well as in environmental monitoring. This sequence represents a PCR primer used in the scope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
